

WORKSHOP MATERIALS

Writing Procedures

Best practices for writing clear, task-oriented procedures and user guides

Richard Rabil

AGENDA

What we'll cover

- Task breakdown
- Definition of a procedure
- Anatomy of a procedure
- Best practices

DISCLAIMER

The following slides assume a documentation team's house style guide as the baseline. Defer to your own team's conventions where they differ.

It's the task, stupid.

Example outline showing the task-oriented nature of user guides and SOPs, for a fictional admin console called Hero Builder:

Getting started

- About Hero Builder
- Accessing Hero Builder
- Managing your projects
- Refreshing and importing data
- Creating a new segment
- Creating a new project

Running a project

- Selecting customers
- Assigning settings to customers
- Testing the selection
- Deploying the selection
- Configuring a common project type
- Configuring a standard launch
- Configuring a standard expansion or refill
- Configuring program changes
- Troubleshooting

DEFINITION

Definition of a procedure

“A procedure is a short description of the steps a user takes to complete a specific task.”

– Microsoft Manual of Style for Technical Publications, 3rd Edition

Note the 1:1 relationship between a task and a procedure.

Anatomy of a procedure

1

Task heading

Creating a New Procedure

A procedure is a set of steps to accomplish a specific task. Procedures should be clear and concise, with no more than one action per step (unless the actions are very small and related, such as when clicking two options within the same menu).

To create a new procedure:

1

Log in to Procedure Composer.

2

Click **New Procedure**.

3

In the **Title** field, enter a title for the procedure.

***Note:** Make sure your title begins with a gerund or infinitive verb.*

4

Optional. In the **Labels** field, add any labels that apply.

5

Click **Save**.

[Back to Top](#)

Task headings

Do

- Start with a gerund or infinitive verb form.
- Use title case or sentence case (defer to your style guide).
- Keep headings as short as possible to keep your mini table of contents clean.

Don't

- Start with “How to.”
- Capitalize articles or prepositions.
- Add colons to the heading.

Introductions

Do

- Provide necessary context — define new or obscure terms.
- Spell out acronyms the first time they're used.
- Explain why the procedure is required or beneficial, or give an example of its purpose.
- Core principle: new hires need it, and every page is page one.

Don't

- Repeat anything that will be clearly described or implied in the course of the procedure.
- Assume readers know what you mean by a given term or acronym.

Procedure headings

- Do: Use bold formatting.
- Do: Use an infinitive verb phrase at the beginning.
- Do: Add a colon at the end.
- Do: Match the procedure title (except for the opening verb).
- Don't: Use italics or a heading style.
- Don't: Omit the procedure heading if there's no introduction — unless your style guide says otherwise.

Steps, part 1

Do

- Use numbered lists to imply sequence.
- Start each step with an active verb.
- Bold terms that refer to sections or clickable elements of the interface.
- Use locators to show where in the interface an action happens — but avoid locator overload.
- Add a “feedback statement” only if it clarifies things; be sparing, or let the locator imply it.
- Add a period at the end of each step.

Don't

- Bury the action in the middle of a long sentence.
- Mix multiple unrelated actions into a single step.

Steps, part 2

● Do

- Use “Do one of the following:” to handle if-then situations.
- Use an expand or disclosure beneath a step for extra detail, if necessary.
- Repeat common steps across procedures for parallelism.
- Precede a step with Optional. if it isn't required.

● Don't

- Use carats (>) for menu paths unless the audience is internal and the meaning is very clear — they're generally bad for localization.
- Cram more than one primary action into a single numbered step.

Images & advanced formatting

● Do

- Use images sparingly, placed directly under the applicable step.
- Use a drop-shadow effect for screenshots.
- Use alignment and proximity to connect an image to its step.
- Use your tool's built-in callout styles rather than one-off formatting.

● Don't

- Use tables to organize everything.
- Insert an image, note, or other element where it's unclear which step it applies to.

Branches or forks

Common scenarios

- Variations depending on the user's role
- Multiple ways to do the same thing

Tactics

- A preliminary procedure that branches into the rest
- “Do one of the following” followed by bullets
- “Do one of the following” followed by a table
- A “You can also...” callout
